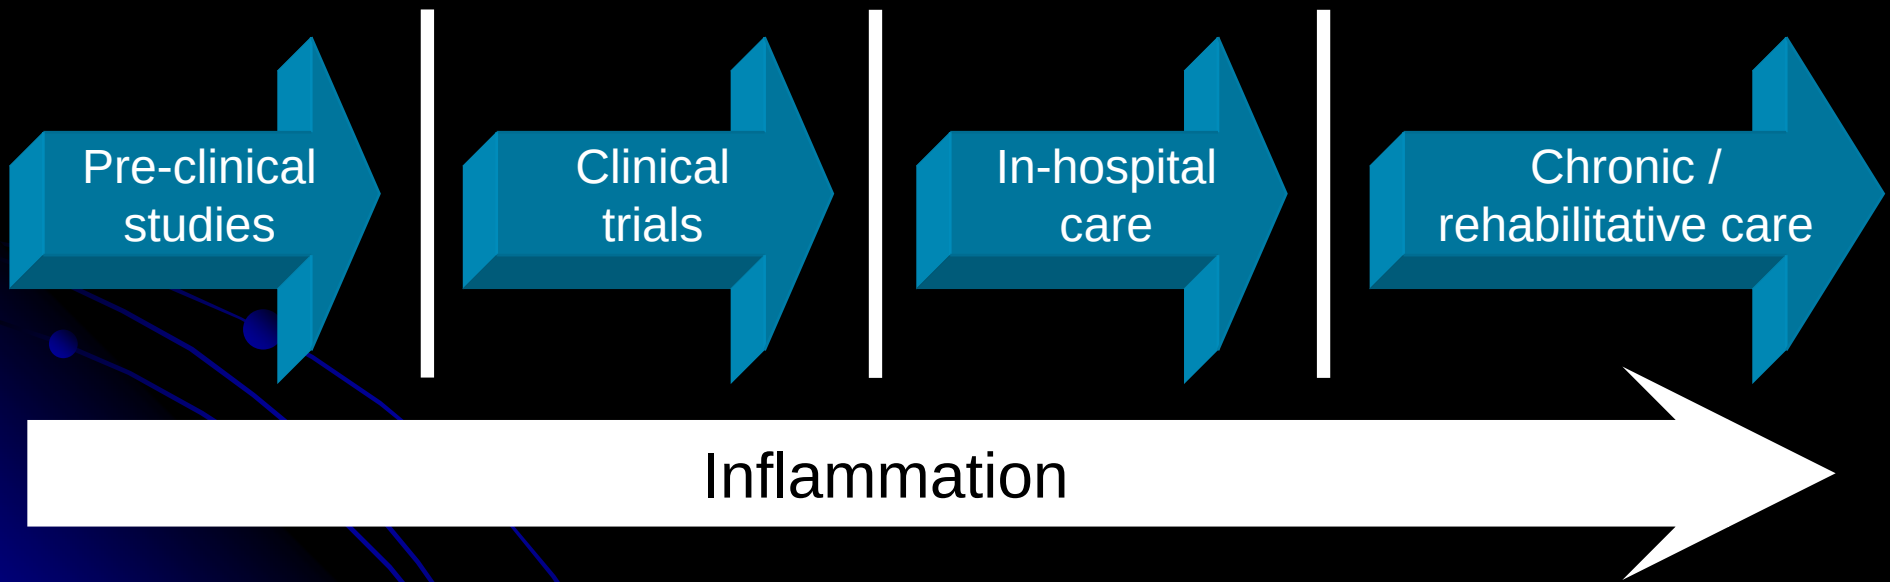
Translational Systems Biology of Inflammation, Wound Healing, and Cancer

Yoram Vodovotz

Director, Center for Inflammation and Regenerative Modeling
Professor of Surgery, Immunology, and Communication Science and Disorders
Visiting Professor of Computational Biology
University of Pittsburgh
www.mirm.pitt.edu/cirm

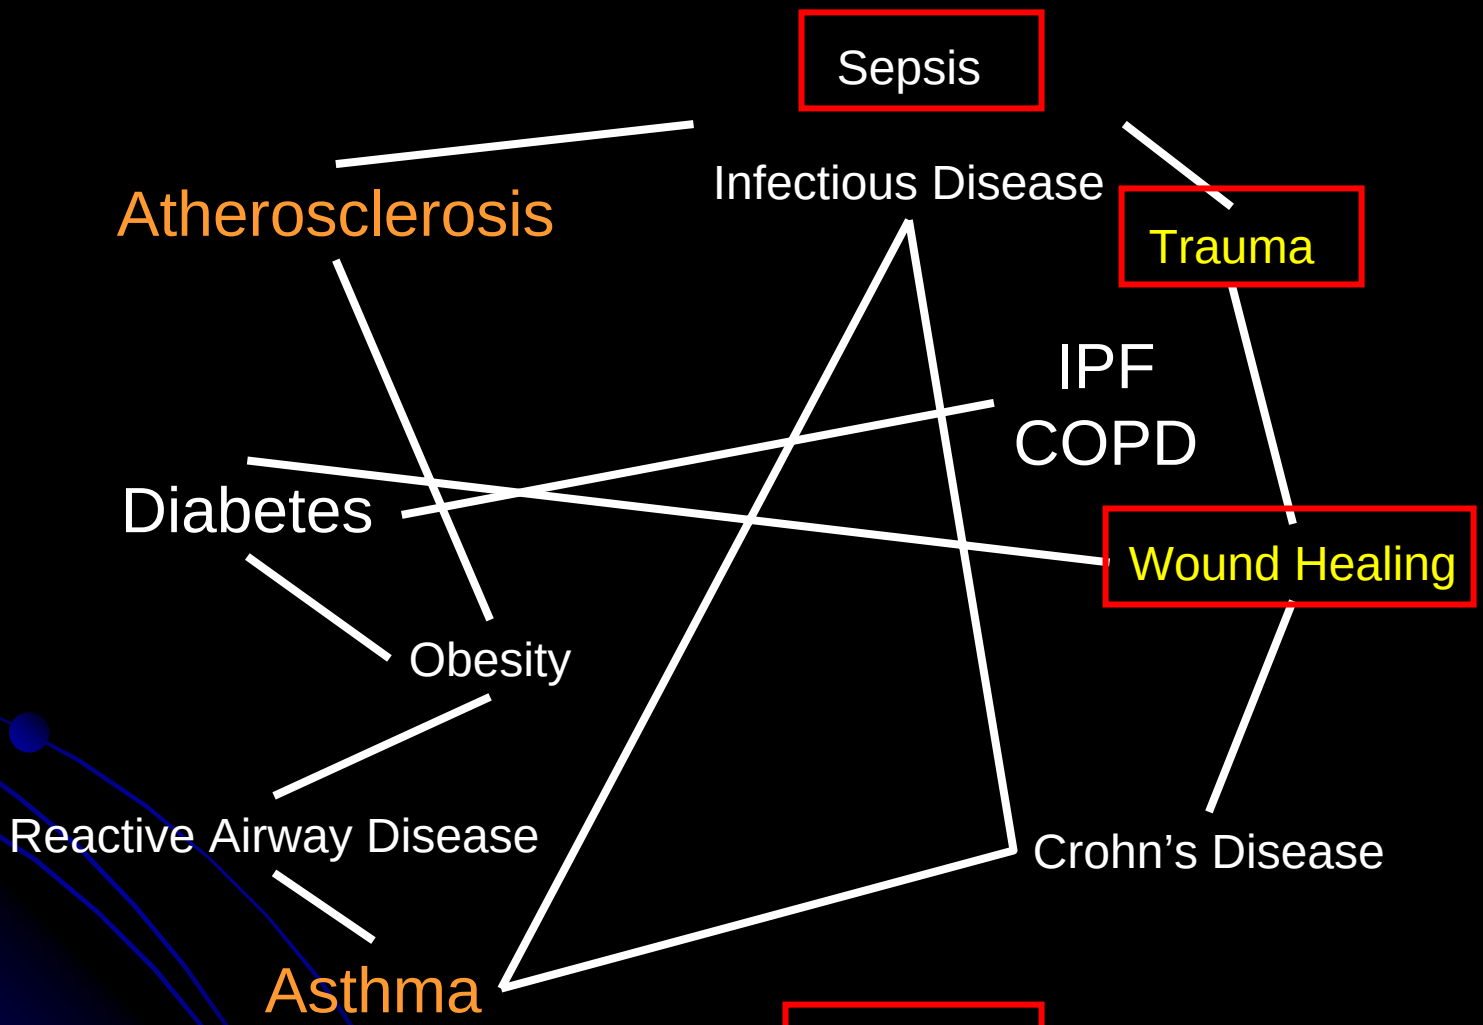
Disclosure: Co-founder of and stakeholder in Immunetrics, Inc.

Traversing the fragmented continuum of healthcare delivery



Y. Vodovotz et al. Math. Biosci. 2009. 217:1

INFLAMMATION



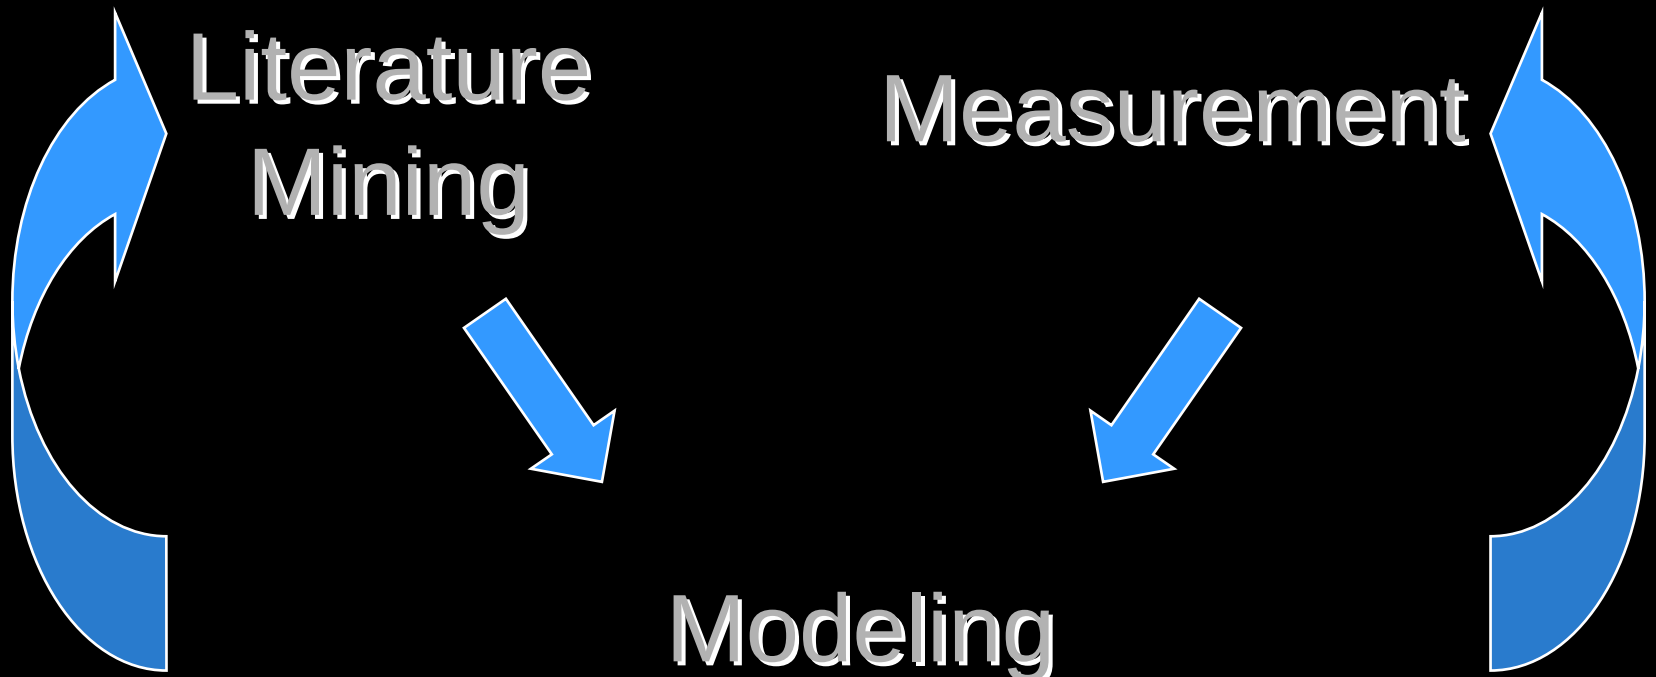
Inflammation is…

- The body's way of informing itself of changes in homeostasis, either from without or within
- Evolutionarily conserved
- Complex, redundant, interconnected
- Necessary for proper healing and regeneration
- Deranged in many disease settings
- A puzzle: inflammation can be both good and bad
- **Is Systems Biology the solution?**

Translational Systems Biology

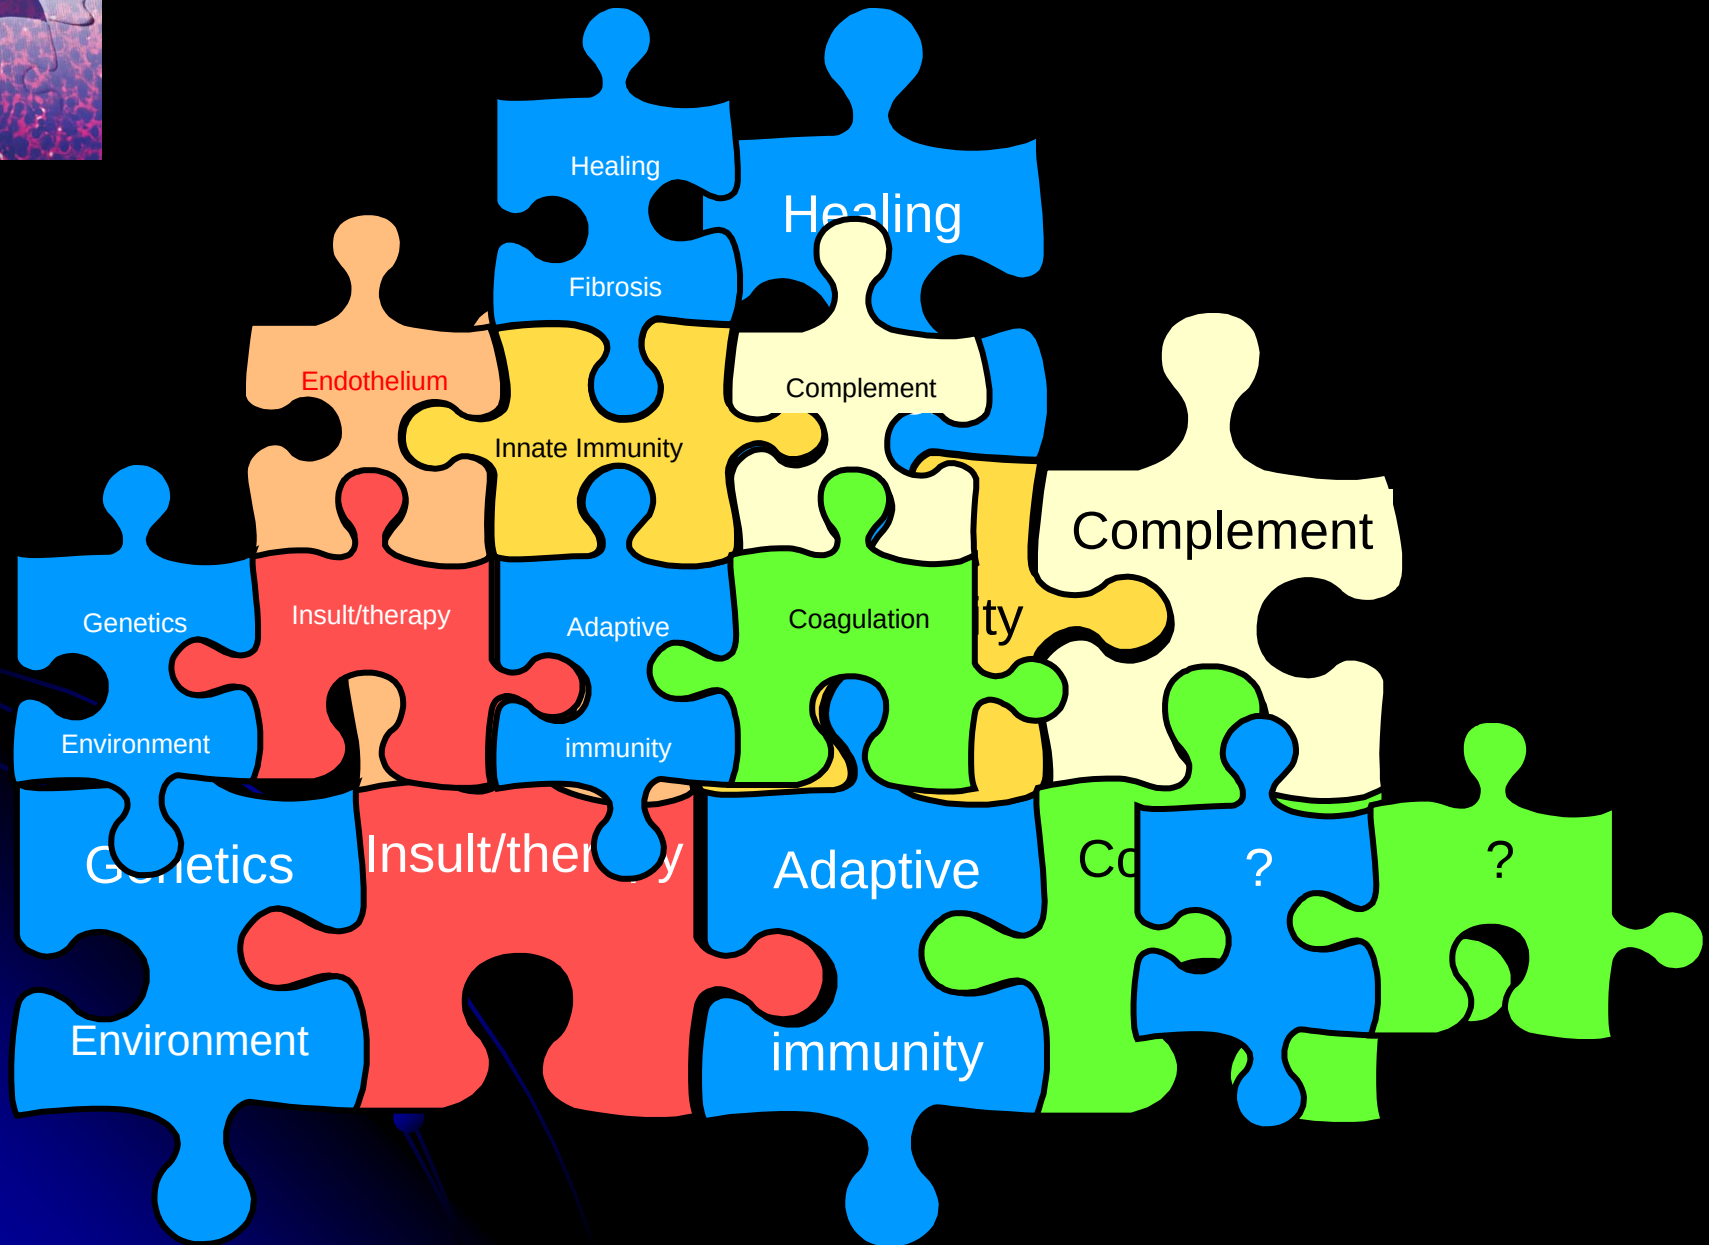
An et al. J. Crit. Care. 2007 22:169; An & Vodovotz, J. Burn Care Res. 2008 29:277; Vodovotz et al, PLoS Comput. Biol. 2008 4:1

"Classical" Systems Biology		Translational Systems Biology
Basic insights are primary focus, (but, how to apply clinically?)	⟺	Translational insights are primary (but, how to incorporate mechanisms?)
Used for basic insights (cellular/molecular interactions, signal transduction)	⟺	Used for clinical utility (*in silico* clinical trials, diagnostics, rational drug/device design)
Simulations designed for laboratory validation	⟺	Simulations designed for eventual clinical validation
"omics" studies associate pattern with outcome	⟺	Mechanistic simulations help explain why outcome associated with a given pattern

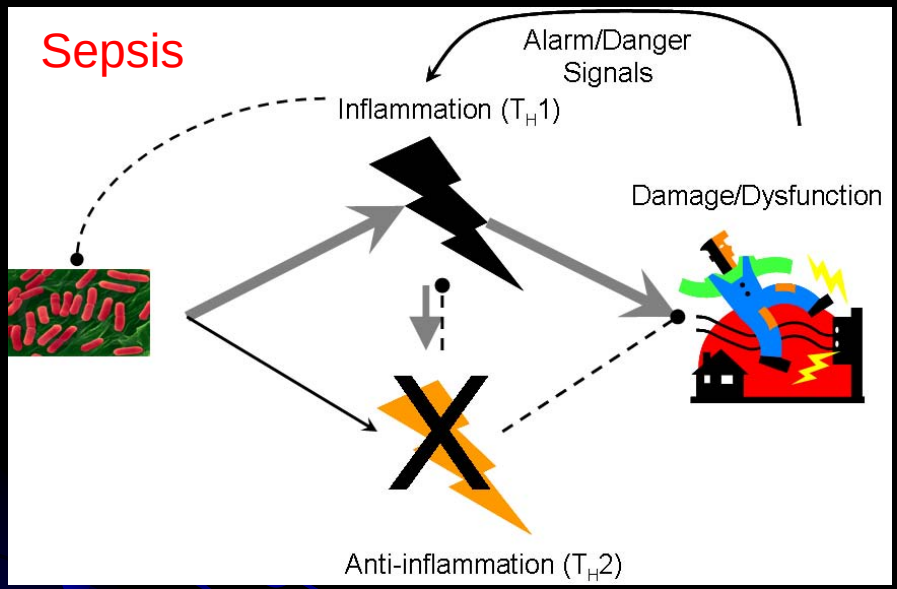


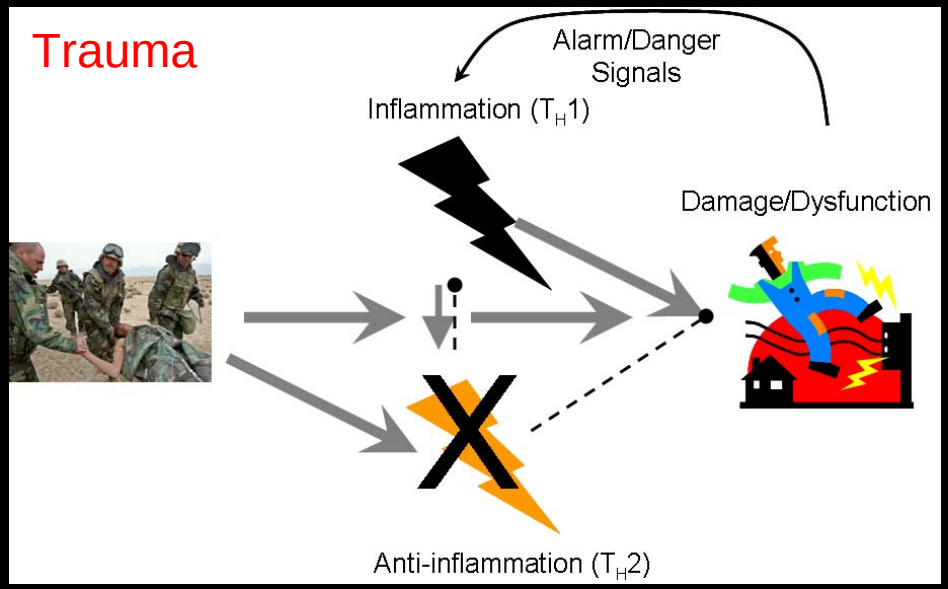
Modulation

From a reductionist approach to inflammation…



…to a systems approach using mechanistic computational simulations





Solid arrow: induction; dashed line: suppression. An initiating stimulus (e.g., pathogen (Panel A) or trauma (Panel B)) stimulates both pro- and anti-inflammatory pathways. In the setting of infection, pro-inflammatory agents (e.g., TNF) cause tissue damage/dysfunction, which in turn stimulates further inflammation (e.g., through the release of "danger signals"). In the case of trauma, tissue damage occurs immediately and further simulates inflammation. Anti-inflammatory agents (e.g., TGF-β1) both suppress inflammation and stimulate healing

(Vodovotz et al, Math Biosci, 2009. 217:1-10).

Modeling: A rational means of traversing the fragmented continuum

Simulate Mechanism

Simulate Clinical Trial

Simulate Individual Patient

Simulate Aging, etc.

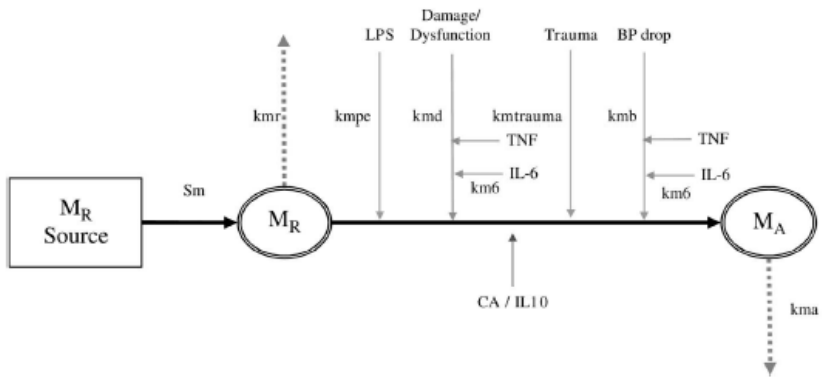

FIG. A1. **A simplified version of macrophage dynamics.** In the model used herein, resting macrophages (M_R) are activated by a number of physiologic processes, including endotoxin (PE), damage/dysfunction, trauma and hypotension (blood pressure [BP] drop). This recruitment process can be upregulated (green lines) in the presence of tumor necrosis factor TNF and interleukin (IL)-6, whereas IL-10 and other antiinflammatory (CA) molecules downregulate (red line) these activating influences. Both resting and activated macrophages (M_A) "die" at their respective rates (gray dotted line). Each process is supported by a literature search.

MODELING

$$M_A' = \left[\left(k_{MLPS}\frac{LPS(t)^2}{1+(LPS(t)/x_{MLPS})^2} + k_{MD}\frac{D^4}{x_{MD}^4+D^4}\right) \times \left(\frac{TNF^2}{x_{MTNF}^2+TNF^2} + k_{M6}\frac{IL6^2}{x_{M6}^2+IL6^2}\right) + k_{MTR}TR(t) + k_{MB}f_B(B)\right]\frac{1}{1+((IL10+CA)/x_{M10})^2}M_R - k_{MA}M_A$$

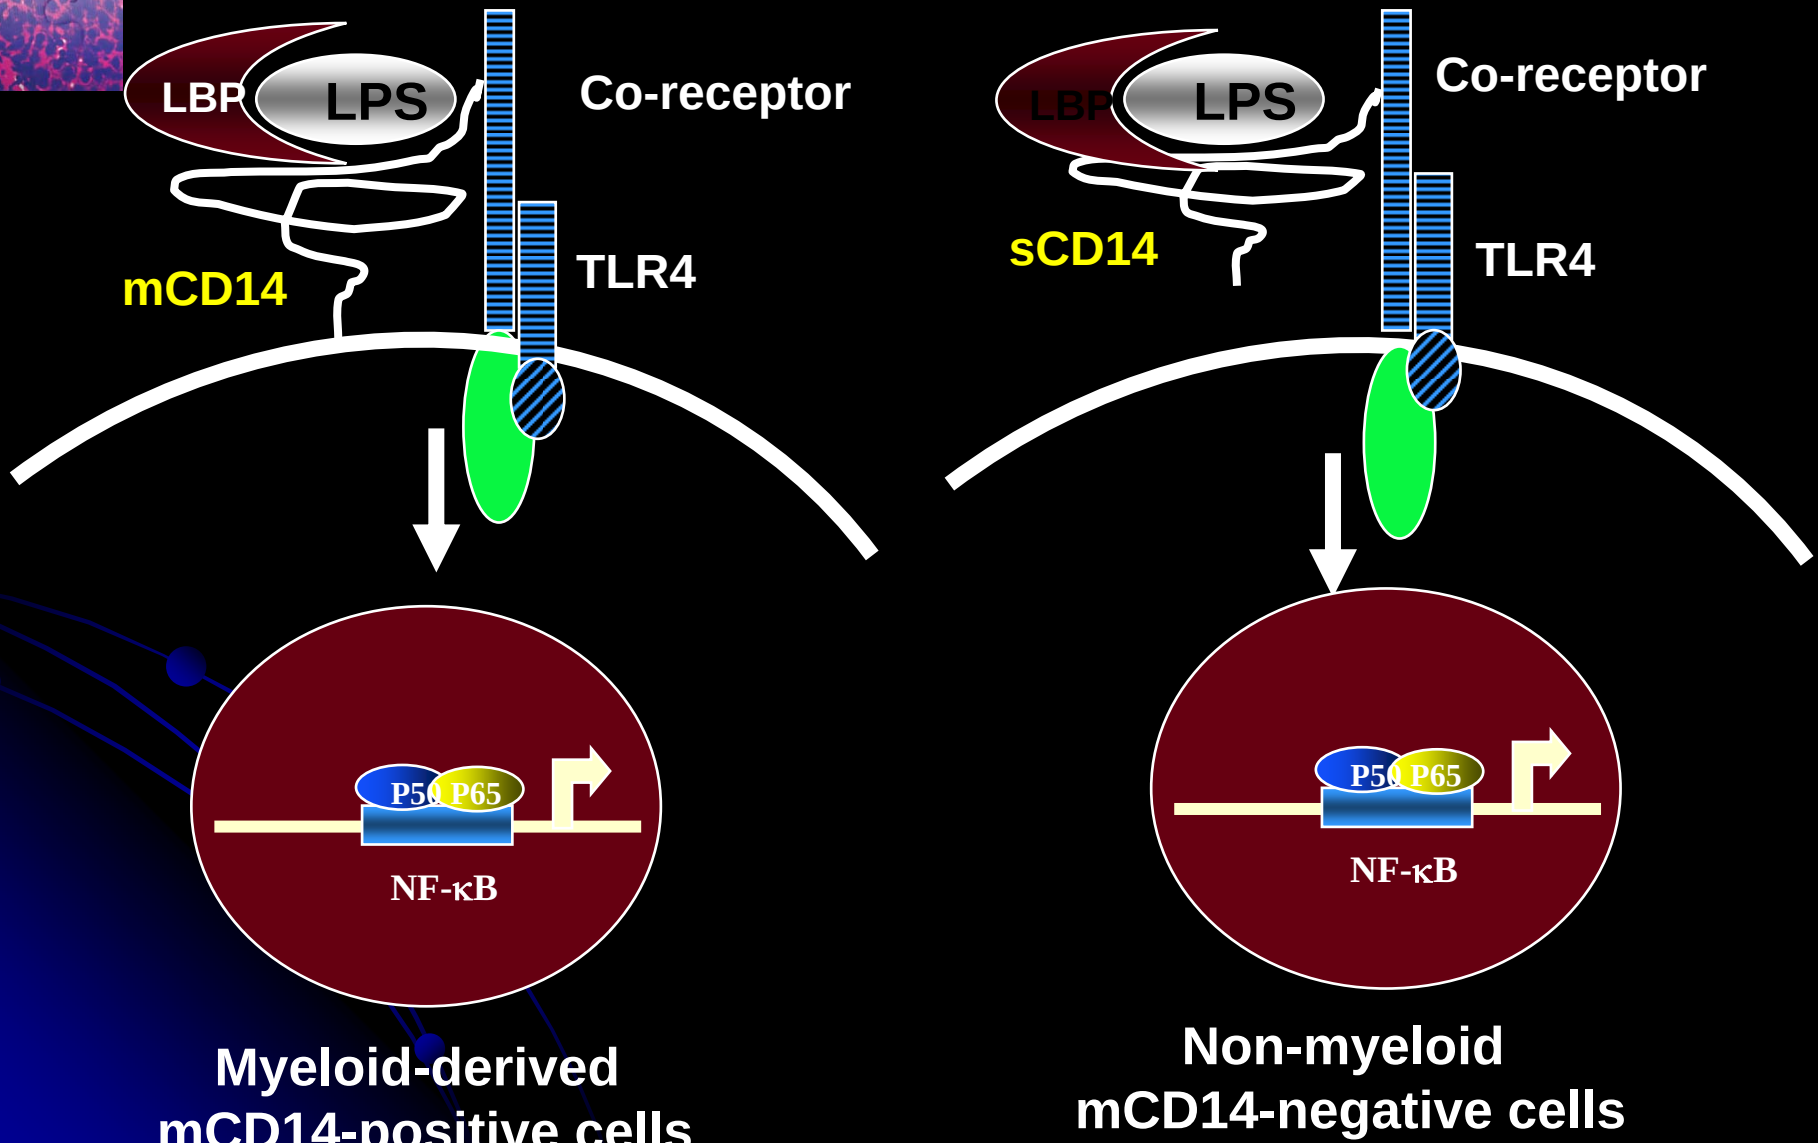
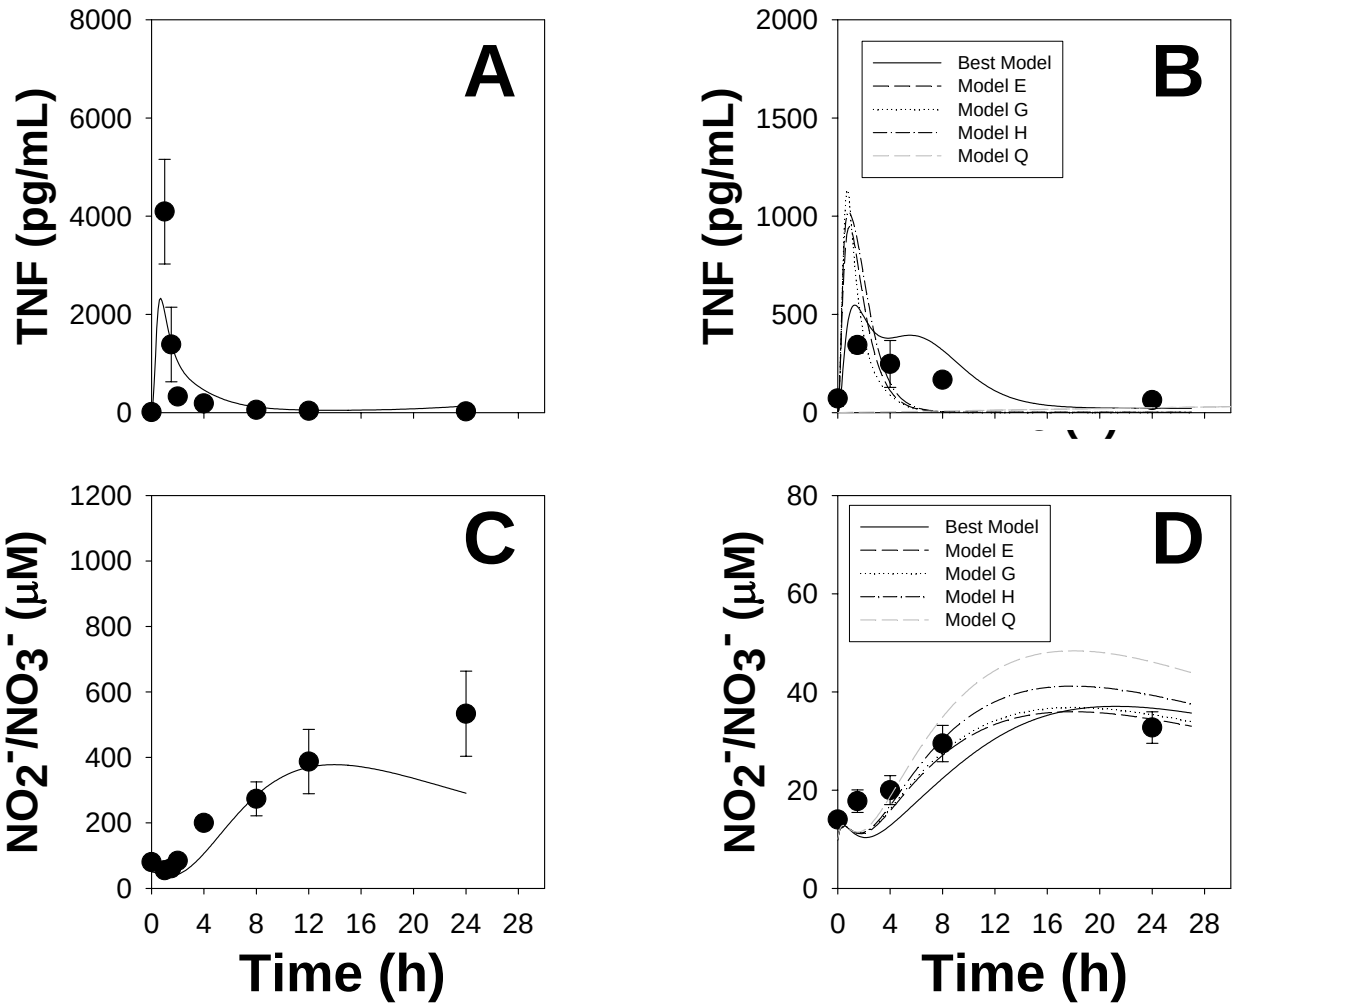
LPS Receptor Complex: Central Role for CD14



Wild Type CD14$^{-/-}$



P50-GM-53789

In Silico and In Vivo Approach to Elucidate the Inflammatory Complexity of CD14-deficient Mice

Jose M Prince,[1] Ryan M Levy,[1] John Bartels,[2] Arie Baratt,[2] John M Kane, III,[1] Claudio Lagoa,[1] Jonathan Rubin,[3,5] Judy Day,[3] Joyce Wei,[2] Mitchell P Fink,[1,4,5] Sanna M Goyert,[6] Gilles Clermont,[4,5] Timothy R Billiar,[1,5] and Yoram Vodovotz[1,5,7]

[1]Department of Surgery, University of Pittsburgh, Pittsburgh, PA, USA; [2]Immunetrics, Inc., Pittsburgh, PA, USA; [3]Department of Mathematics, University of Pittsburgh, Pittsburgh, PA, USA; [4]Department of Critical Care Medicine, University of Pittsburgh, Pittsburgh, PA, USA; [5]McGowan Institute for Regenerative Medicine, Center for Inflammation and Regenerative Modeling, University of Pittsburgh, Pittsburgh, PA, USA; [6]North Shore-Long Island Jewish Research Institute/New York University School of Medicine, Manhasset, NY, USA; [7]Department of Immunology, University of Pittsburgh, Pittsburgh, PA, USA

- Re-calibrate baseline model for data in $CD14^{-/-}$ mice
- Activation of leukocytes by LPS is ~40-fold lower in $CD14^{-/-}$ mice
- Altered IL-6 physiology in $CD14^{-/-}$ mice
  - Enhanced propensity to produce and secrete IL-6 both at rest (~20-fold) and in response to stimulation (~60-fold)
  - Greater degradation rate of IL-6 (~25-fold)
- Altered NO physiology
  - Decreased iNOS expression (5-fold) in $CD14^{-/-}$ mice
  - Decreased baseline NO_2^-/NO_3^- levels (5-fold) in $CD14^{-/-}$ mice

Recalibration: From Mice to Swine…

R33-HL-089082

- The base model was never trained to any experimental data from pigs
- First step was to fit the model parameters to the time course data from any of the individual pigs
- The time course data that was used for fitting included:
  - Blood pressure
  - TNF, IL-6, IL-10, NO_2^-/NO_3^-
- Using a form of sensitivity analysis, a reduced list of parameters that need re-estimation was determined
- 52 parameters were then estimated to fit the time course of a pig that survived endotoxemia with no subsequent complications, using a genetic algorithm
- The best scored models generated were then clustered and the centroids of the clusters are shown

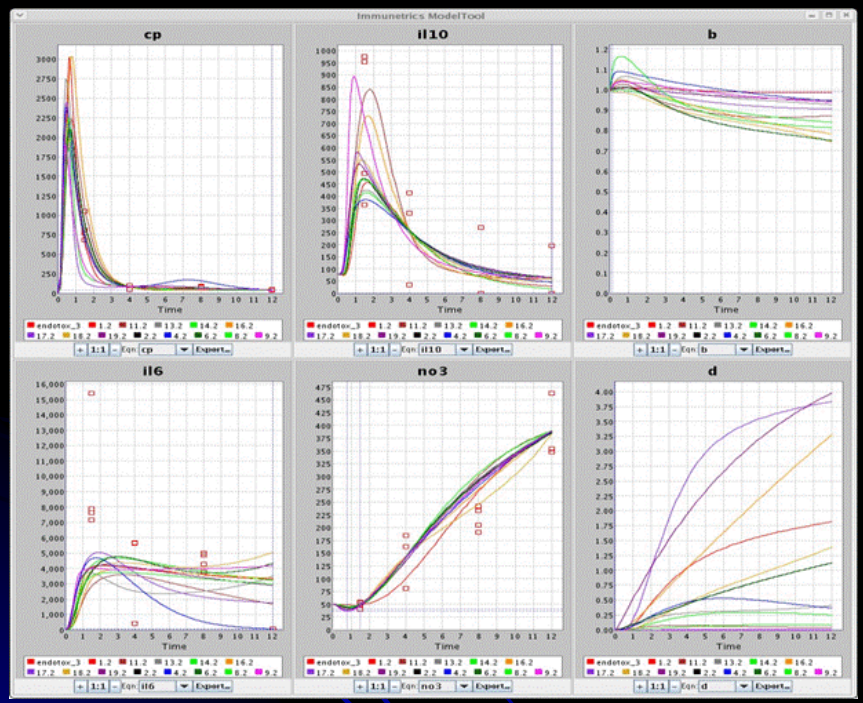
MIC-1/GDF-15:

- A member of TGF-β super-family
- 2nd Network (high score)
- Focus Gene (= relevant): ↑ ~45-fold
- Part of cell death/cell proliferation network

Recalibration: GDF-15/MIC-1$^{-/-}$ mice



- Model re-calibration performed as for CD14$^{-/-}$ mice
- Suggested that GDF-15/MIC-1$^{-/-}$ mice have underlying alterations in parameters related to
  - Neutrophils
  - TNF
  - IL-6

Inflammation

Wound Healing

Cancer

Hepatitis C and Hepatocellular Carcinoma

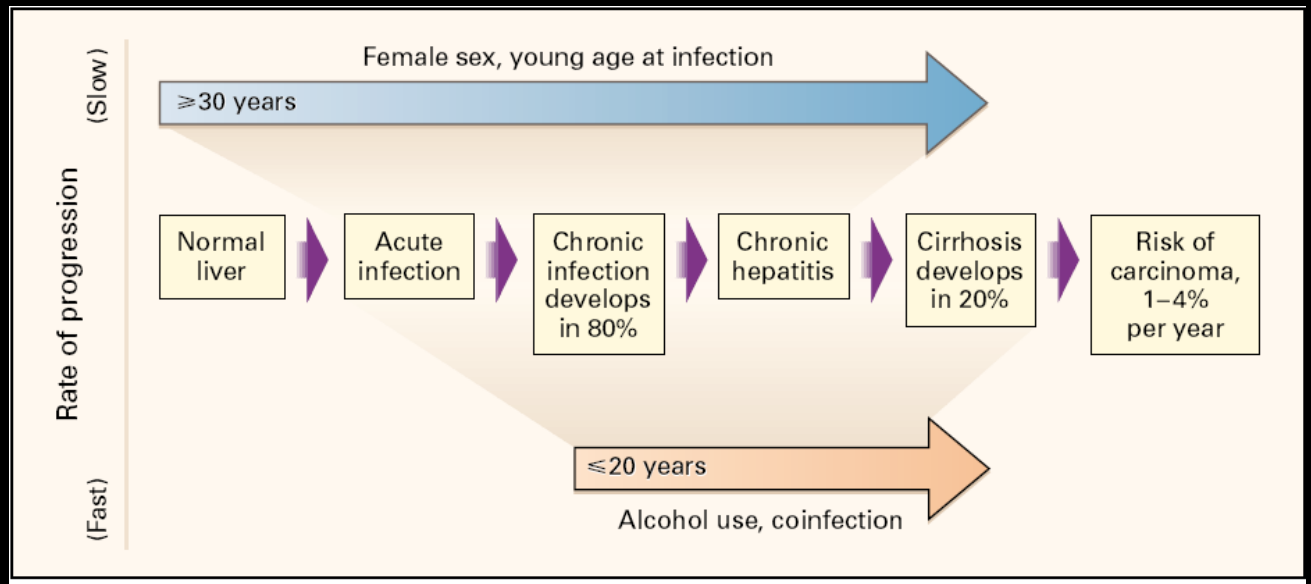

Figure 2. The Natural History of HCV Infection and Its Variability from Person to Person.

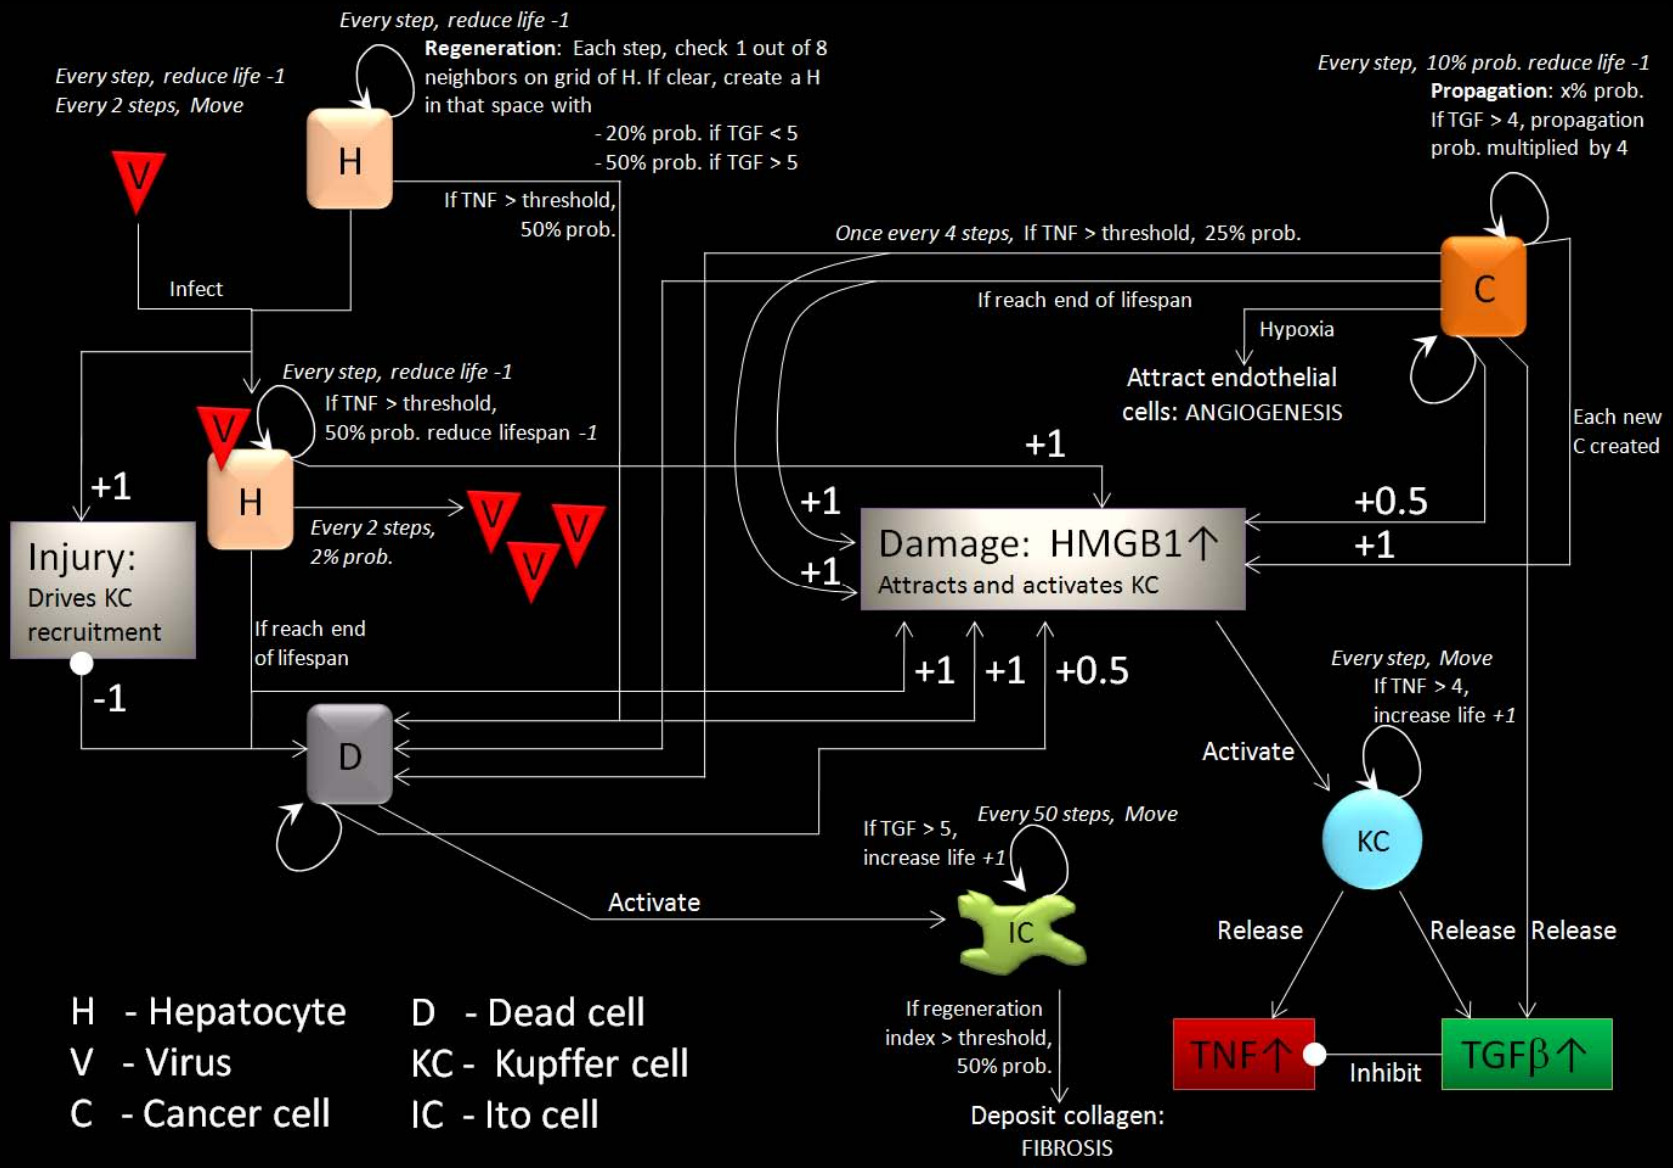
- Acute HCV infection often progresses to chronic infection
- It is common for the virus to persist at low levels
  - Even when high levels of HCV RNA available, assembled virions are few and rarely overwhelm the system (*in vitro* or *in vivo*)
  - This provides a potential mechanism that encourages chronic development: replication of HCV may be too low to provide sufficient MHC I–HCV peptide complex on the surface of the hepatocyte, thereby protecting from CTL-mediated killing

Model Rules

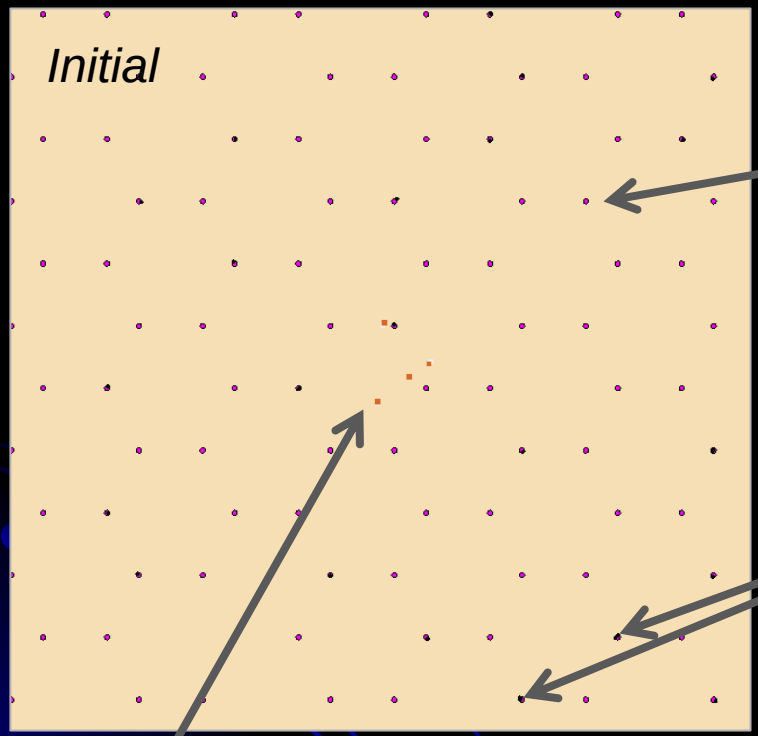


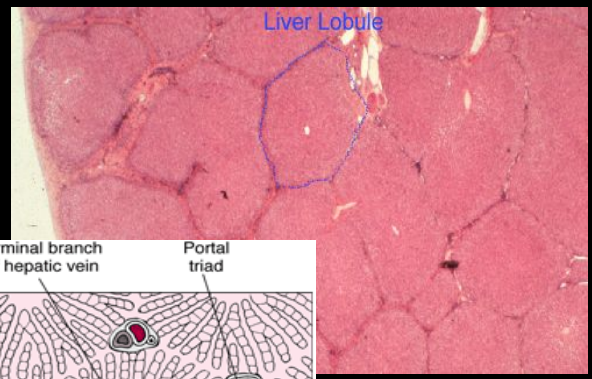
Dutta-Moscato, Soloveyv, Mi, Vodovotz, Unpublished

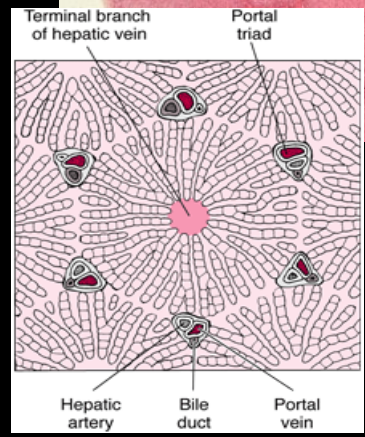
Provisional patent application: “In Silico Strategies for Cancer Diagnosis and Therapy” (Serial No. 61/186,126)

Structure of the model

Baseline circulatory system providing nutrients to healthy tissue: Grid simulating hexagonal assembly of portal triads







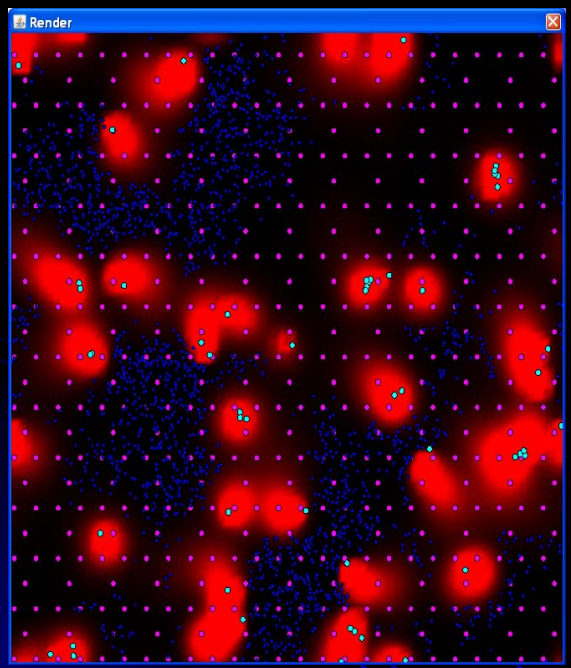
Also serves as entry point for HCV, as a blood borne virus

Cancer progenitor cells initialized to 4, dispersed near the center of region of interest

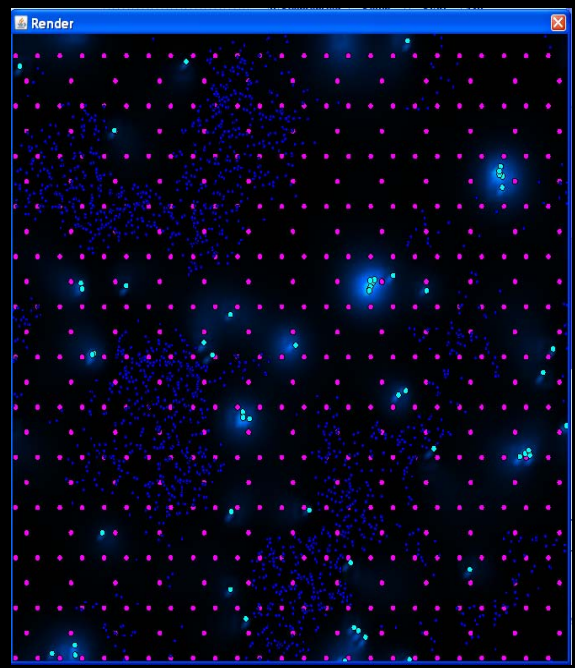
Dutta-Moscato, Soloveyv, Mi, Vodovotz, Unpublished

Structure of the model

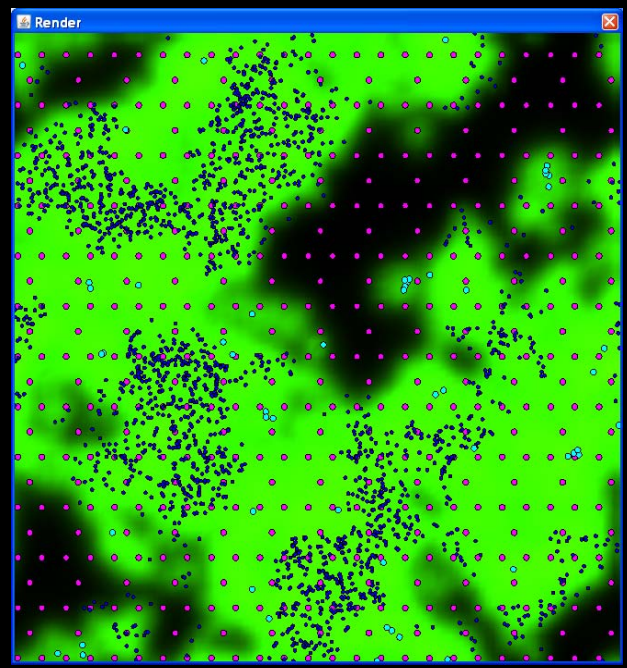
Underlying data layers: Allow “Monitor” multiple cytokine levels simultaneously



TNF



TGF-β1

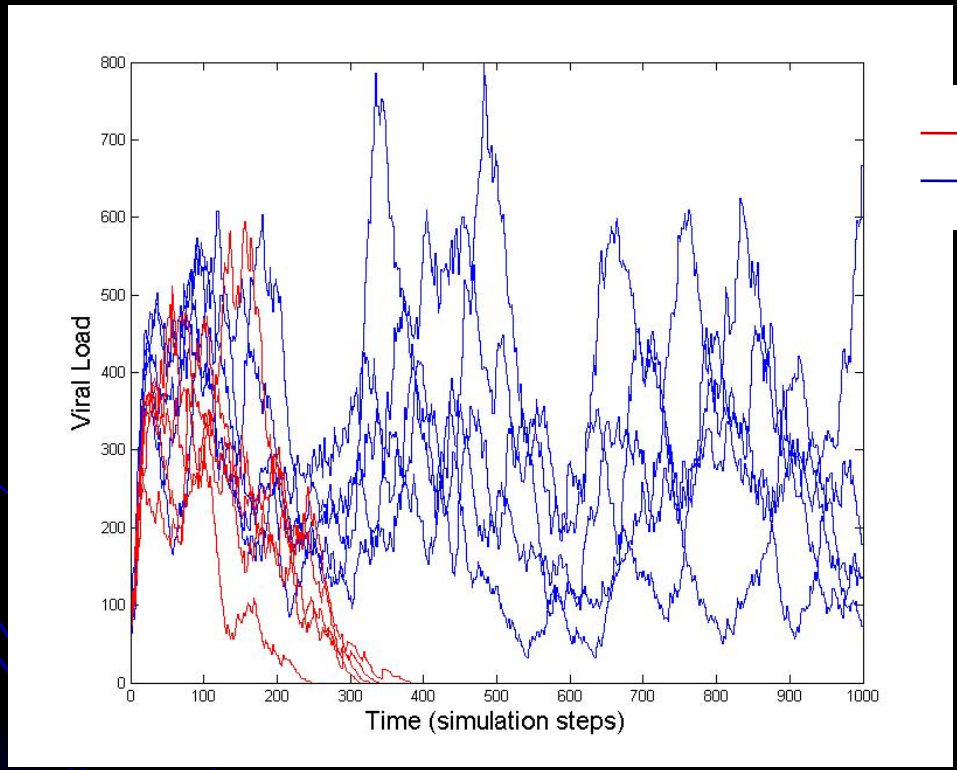


HMGB1

Dutta-Moscato, Soloveyv, Mi, Vodovotz, Unpublished

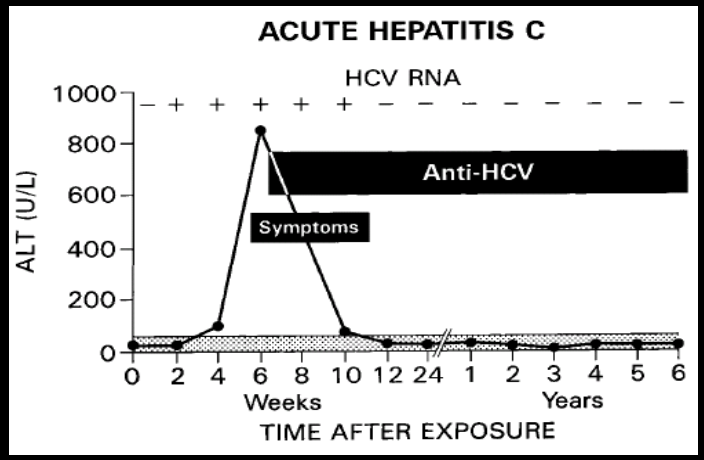
Model: Acute vs Chronic

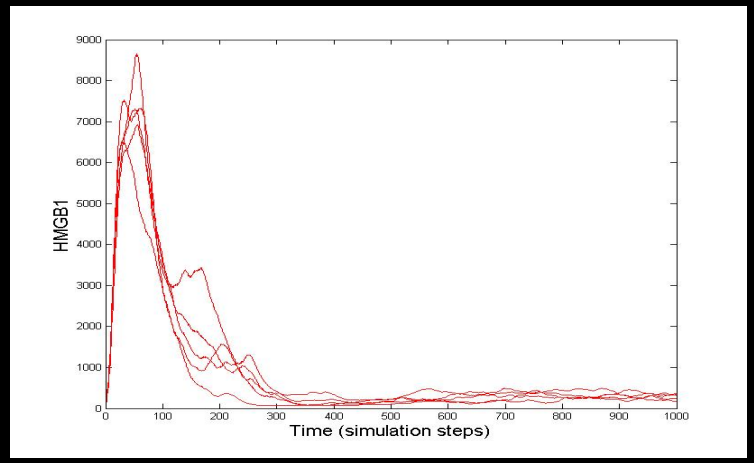
Starting with identical initial conditions, random selection from the same distribution of viral inoculation, the model stochastically results in cases where HCV resolves following acute infection, or persists as a chronic infection

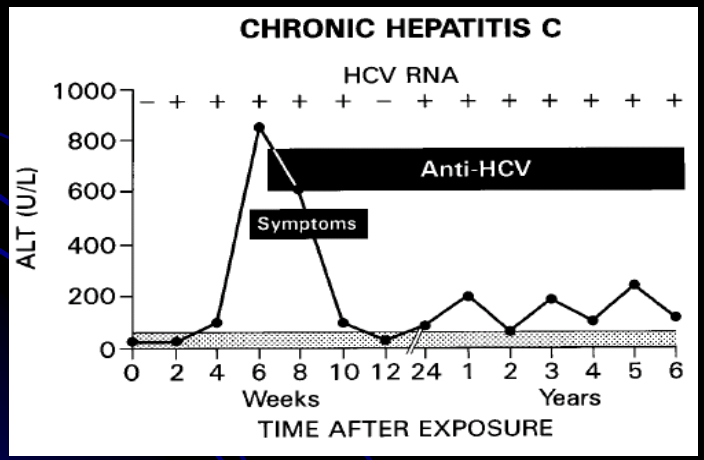


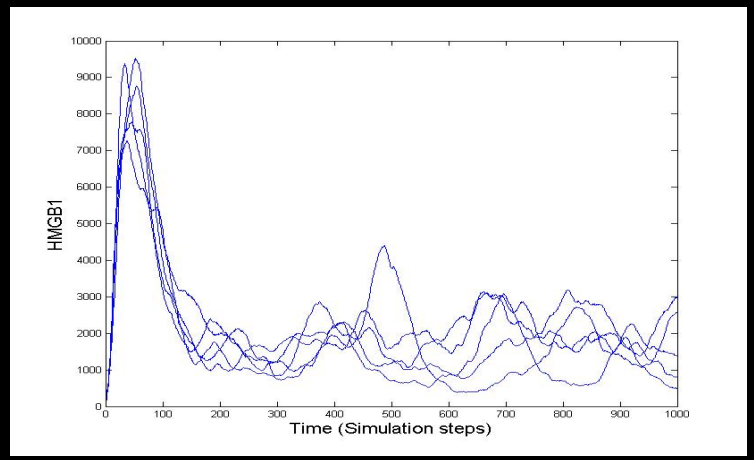
Dutta-Moscato, Soloveyv, Mi, Vodovotz, Unpublished

Measures of Damage: Clinical vs. Model









Clinical data

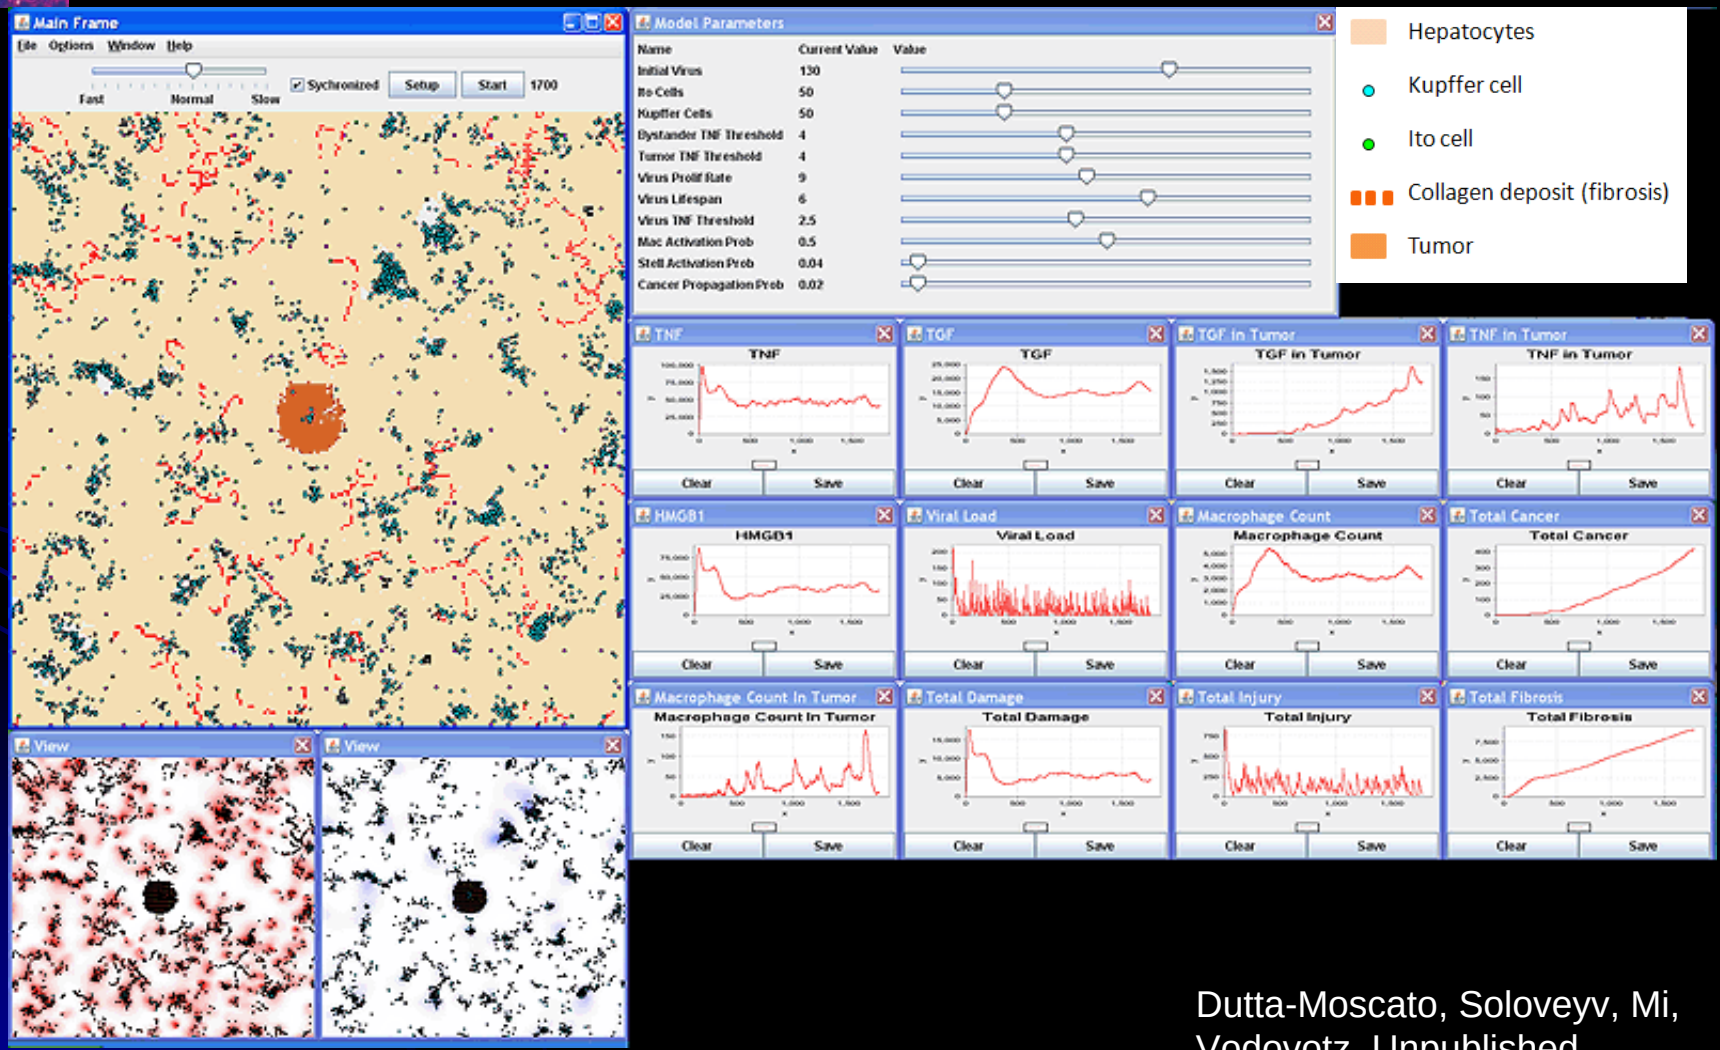
Serological course of Hepatitis C

Hoofnagle JH (1997) Hepatology 26(Suppl 1):15S-20S

Model simulation > 1 year

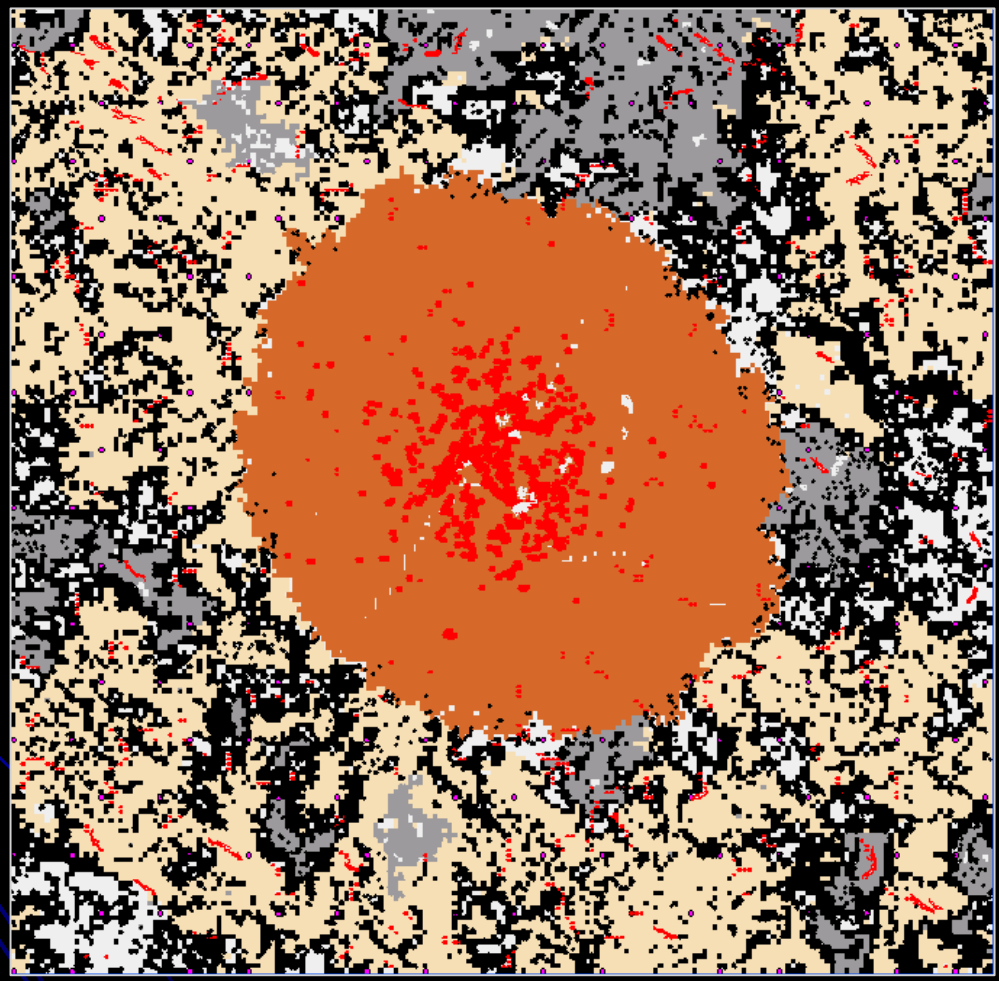
Dutta-Moscato, Soloveyv, Mi, Vodovotz, Unpublished

Initiation and Progression of HCC: Initial Tumor Formation



Dutta-Moscato, Soloveyv, Mi, Vodovotz, Unpublished

Initiation and Progression of HCC: Formation of Hypoxic Core and Angiogenesis



Dutta-Moscato, Soloveyv, Mi, Vodovotz, Unpublished

Main problem: time required for inflammation assays and personalized modeling may be too slow for effective therapy for fast-evolving inflammatory processes

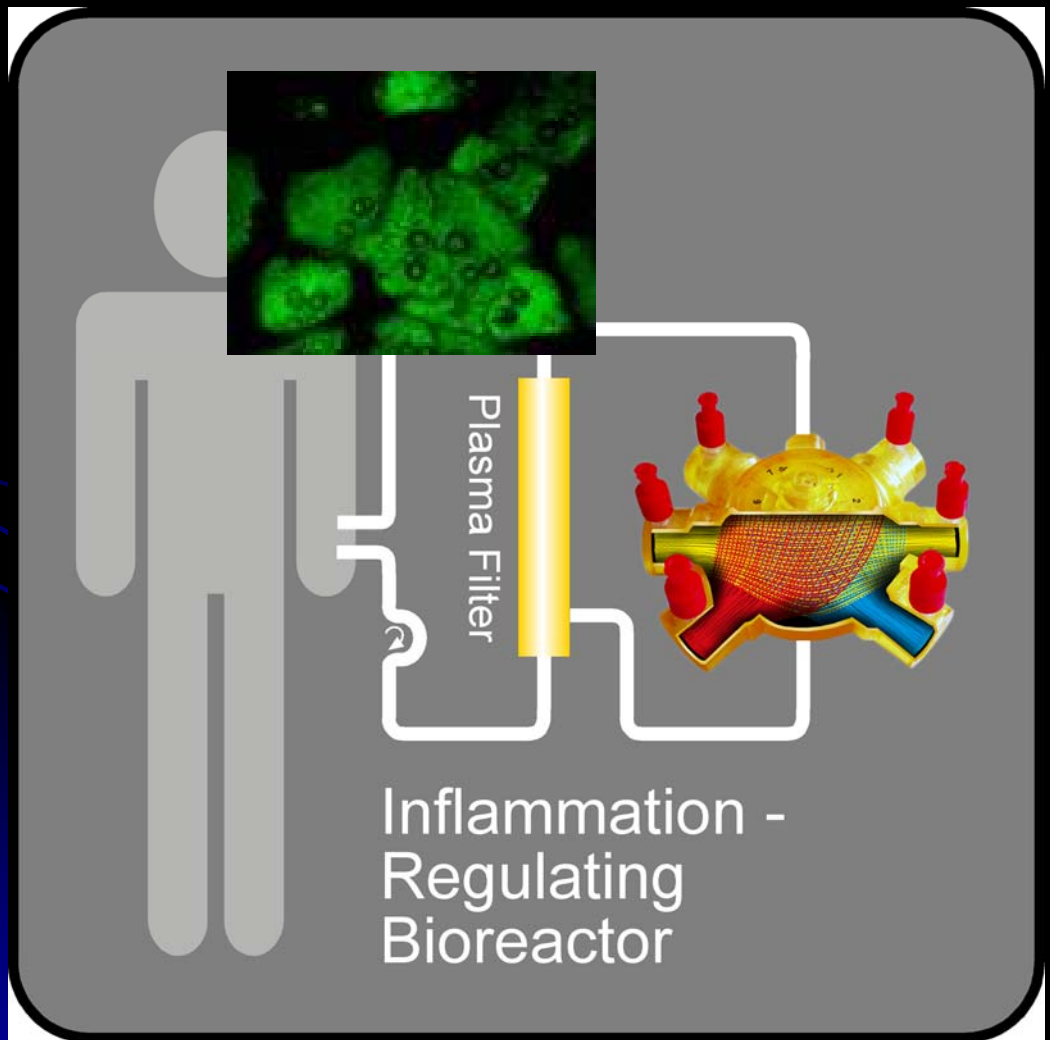
Patient-specific, inflammation-regulating bioreactor

Provisional patent application: “Self-Regulating Device for Modulating Inflammation.” (Serial No. 61/100,845)

DoD X81XWH-07-1-0415

Rational Inflammation Reprogramming

CYTOKINE PROMOTER | **ENDOGENOUS INHIBITOR**



Benefits:

- Single device for FDA
- Self-regulating
- Response can be tuned
- Modular
- Infinitely modifiable
- Designed using mathematical model to be disease/stage-specific

Uses:

- Sepsis
- Trauma
- Chronic diseases
- Wound healing
- Burns?

Summary: Translational Systems Biology of Inflammation

- Measurement: Novel methods of analysis for the development of cytokines as biomarkers
- Modeling: Computational simulations of inflammation and damage / healing in various inflammatory diseases
  - *In silico* clinical trials
  - “Smart” diagnostics
- Modulation: A prototype inflammation-regulating bioreactor

So… what is still needed?

- Automate literature mining → modeling
- Extraction of data for validation of conceptual models, parameter estimation
- **Example:** Gary An Shock Bioinformatics Initiative
  - Initial Premise: Scientific Societies would be a good "functional level" to implement collaborative curation to augment lexicon development
  - Develop means to capture the knowledge of the Shock Society
  - Present this knowledge in a fashion beneficial to the Shock Membership
  - Knowledge in the Abstracts Presented at the Annual Shock Society Meeting
  - Use of advances in computer technology to access, process, extract and represent knowledge published in the biomedical literature
