Conclusion

Towards Efficient and Expressive Runtime Monitors

Understanding Complex Systems by Monitoring their Execution

Klaus Havelund Jet Propulsion Laboratory California Institute of Technology

April 20, 2012

ntract

calaRules

▲ロト ▲帰 ト ▲ ヨ ト ▲ ヨ ト ・ ヨ ・ の Q ()

Conclusion

In Collaboration With

- University of Manchester, UK
 - Howard Barringer (Professor)
 - Giles Reger (Ph.D. student)
 - David Rydeheard (Dr.)
- University of Grenoble, France
 - Yliès Falcone (Associate Professor)

- What Runtime Verification is
- From propositional to parametric properties
- Quantified Event Automata (an automaton approach)

- TraceContract (a formula rewriting approach)
- ScalaRules (a production rule system approach)
- Conclusion

Runtime Verification

• *Monitoring* the runtime behavior of a system with respect to a user-defined *property*

▲ロト ▲帰 ト ▲ ヨ ト ▲ ヨ ト ・ ヨ ・ の Q ()

- Need to instrument system to select relevant events
- Online or offline (log-files)
- If online
 - verdict returned after each event
 - can give feedback to steer the system

Runtime Verification in Theory

- Events record runtime behavior
 - snapshots of state or actions performed
- A finite sequence of events is a trace τ
- A property ϕ denotes an event language $\mathcal{L}(\phi)$ (a set of traces)

• au satisfies ϕ iff $au \in \mathcal{L}(\phi)$

Runtime Verification in Theory

- Should detect success/failure before end of trace
- Standard approach is to use four-valued verdict domain
- Consider all possible extensions of a trace

	current trace $ au$	all suffixes σ	Action
1	$ au \in \mathcal{L}(arphi)$	$ au \sigma \in \mathcal{L}(arphi)$	stop with Success <i>T</i>
2	$ au \in \mathcal{L}(arphi)$	unknown	carry on monitoring T_p
	$ au otin \mathcal{L}(arphi)$	$ au otin \mathcal{L}(arphi)$	stop with Failure <i>F</i>
4	$ au otin \mathcal{L}(arphi)$	unknown	carry on monitoring F _p

Conclusion

Runtime Verification in Practice

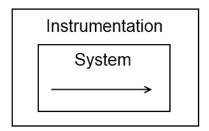

• Start with a system to monitor

▲□▶ ▲圖▶ ▲臣▶ ▲臣▶ ―臣 … のへで

Runtime Verification in Practice

• Instrument the system to record relevant events

t Sc

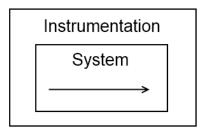

▲□▶ ▲圖▶ ▲臣▶ ▲臣▶ ―臣 … のへで

Conclusion

Runtime Verification in Practice

• *Generate* a monitor from the property

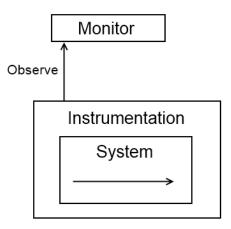

t Sc

Conclusion

Runtime Verification in Practice

• *Dispatch* each received event to the monitor.

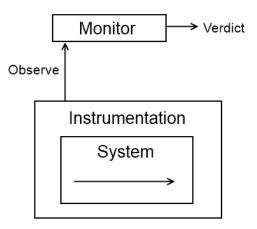

◆□▶ ◆□▶ ◆三▶ ◆三▶ ○□ のへで

▲ロト ▲帰 ト ▲ ヨ ト ▲ ヨ ト ・ ヨ ・ の Q ()

Runtime Verification in Practice

• Compute a *verdict* for the trace received so far.

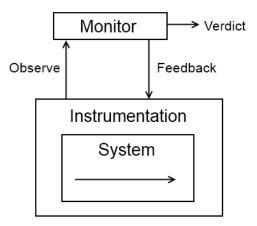

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Conclusion

Runtime Verification in Practice

• Possibly generate *feedback* to the system.

Runtime Verification Applications

• Detect erroneous behavior after deployment (fault protection)

▲ロト ▲帰 ト ▲ ヨ ト ▲ ヨ ト ・ ヨ ・ の Q ()

- Detect intrusion after deployment (security)
- Monitor as part of testing before deployment (test oracles)
- Program understanding

Some Context

- Field started with propositional monitoring
 - events are just strings
- Recently moved to parametric monitoring
 - events include data values
- Solutions exist spanning the two classical dimensions

- Expressiveness of specification language
- *Efficiency* of monitoring algorithm
- This work is looking for the right combination

The Propositional Approach : An Example

- Record *propositional* events, for example
 - open, close
- Define a property over propositional events, for example
 - LTL (finite-trace) $\square(\texttt{open} o \bigcirc (\neg \texttt{open} \ \mathcal{U} \ \texttt{close}))$
 - RE (open.close)*

• DFA

• Check if each trace prefix is in the language of the property

Conclu

▲ロト ▲帰 ト ▲ ヨ ト ▲ ヨ ト ・ ヨ ・ の Q ()

Going Parametric

Consider the code

```
File f1 = new File("manual.pdf");
File f2 = new File("readme.txt");
f1.open();
f2.close();
f1.close();
```

C

▲ロト ▲帰 ト ▲ ヨ ト ▲ ヨ ト ・ ヨ ・ の Q ()

Going Parametric

Consider the code

```
File f1 = new File("manual.pdf");
File f2 = new File("readme.txt");
f1.open();
f2.close();
f1.close();
```

• Say we just focus on propositional events

open.open.close.close

Conclusion

Going Parametric

Consider the code

```
File f1 = new File("manual.pdf");
File f2 = new File("readme.txt");
f1.open();
f2.close();
f1.close();
```

• Say we just focus on propositional events

open.open.close.close

• No good, we want to *parameterize* events with data values and use those values in the specification

Conclusion

Going Parametric

Consider the code

```
File f1 = new File("manual.pdf");
File f2 = new File("readme.txt");
f1.open();
f2.close();
f1.close();
```

• Say we just focus on propositional events

open.open.close.close

- No good, we want to *parameterize* events with data values and use those values in the specification
- Instead record the parametric trace

open(manual.pdf).open(readme.txt).close(readme.txt).close(manual.pdf)

ract

ScalaRules

▲□▶ ▲圖▶ ▲臣▶ ▲臣▶ ―臣 … のへで

Conclusion

Parametric Properties

- Using the events
 - open(f) when file f is opened
 - close(f) when file f is closed

Contract

ScalaRules

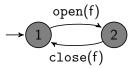

イロト 不得 トイヨト イヨト

3

Conclusion

Parametric Properties

- Using the events
 - open(f) when file f is opened
 - close(f) when file f is closed
- the property becomes

Conclusion

Instantiating Parametric Property

• Let f = readme.txt (a binding)

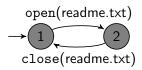

Conclusion

▲ロト ▲帰 ト ▲ ヨ ト ▲ ヨ ト ・ ヨ ・ の Q ()

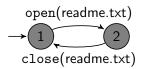

Instantiating Parametric Property

- Let f = readme.txt (a binding)
- Instantiated property becomes

Instantiating Parametric Property

- Let f = readme.txt (a binding)
- Instantiated property becomes

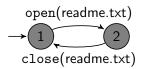

• Given parametric trace

open(manual.pdf).open(readme.txt).close(readme.txt).close(manual.pdf)

Instantiating Parametric Property

- Let f = readme.txt (a binding)
- Instantiated property becomes

• Given parametric trace

open(manual.pdf).open(readme.txt).close(readme.txt).close(manual.pdf)

- to get Event Automaton (3) (1) (42, max) (2) (42, new) (new) = max (max) (new) = max(max) (max) (max)
- keep local state per instantiated parametric property
- treat quantified and unquantified variables differently

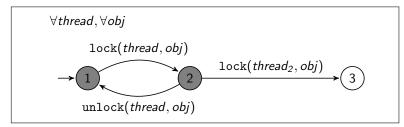

• Every object can only be locked once at any one time

▲ロト ▲帰 ト ▲ ヨ ト ▲ ヨ ト ・ ヨ ・ の Q ()

Every object can only be locked once at any one time

lock is used with two different lists of formal parameters

Event Automata : Definition

Definition (Event Automaton)

An Event Automaton $\langle Q, \mathcal{A}, \delta, q_0, F \rangle$ is a tuple where

- Q is the set of states,
- $\mathcal{A} \subseteq Event$ is the alphabet,
- $\delta \in (Q \times A \times Guard \times Assign \times Q)$ is the transition set,
- q₀ is the initial state, and
- $F \subseteq Q$ is the set of final states.

ScalaRules

Conclusion

Quantified Event Automata : Definition

Definition (Quantified Event Automaton)

- A QEA is a pair $\langle\Lambda,E\rangle$ where
 - E is an EA, and
 - $\Lambda \in (\{\forall, \exists\} \times \text{ variables}(E) \times Guard)^*$ is a list of quantified variables with guards.

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

• (To be) used by LADEE: Lunar Atmosphere and Dust Environment Explorer

Conclusion

The Task Monitor Example

```
trait Event
case class End(task: Int, step: Int) extends Event
```

```
class TaskMonitor extends Monitor[Event] {
    always {
      case End(task, step1) =>
      watch {
        case End('task ', step2) => step2 > step1
      }
   }
}
```

Analyzing a Trace

```
object Test extends Application {
    val m = new TaskMonitor
```

```
val trace = List(
   End(1, 2),
   End(2, 1),
   End(1, 3),
   End(2, 2),
   End(1, 1))
```

```
m.verify(trace)
}
```

Conclusion

Implementation of TraceContract

```
trait Monitor[E] extends RuleSystem {
    var current: state = True
```

```
trait state {
  def apply(e: E): state
  def and(that: state) = And(this, that) reduce
  def or(that: state) = Or(this, that) reduce
}
```

```
type Body = PartialFunction[E, state]
```

```
case class watch(b: Body) extends state {
  def apply(e: E) = if (b.isDefinedAt(e)) b(e) else this
}
...
```

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ ─臣 ─のへで

Implementation using Rewriting

```
case class repeat(b: Body) extends state {
  def apply(e: E) =
    if (b.isDefinedAt(e)) And(b(e), this) reduce else this
}
```

```
def init (s: state) {current = s}
```

```
def always(b: Body) = init(repeat(b))
```

```
def apply(e: E) {
    current = current(e)
    if (current == False) println("*** safety violation")
}
```

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Conclusion

RETE Network for a Rule

rule: $a(x), b(x, y), c(x, y) \Rightarrow action$

Conclusion

Future Work

- Theoretic foundations
 - QEA
 - TraceContract
- Implementation
 - Implement efficient monitoring algorithm for QEA
 - Explore utility of RETE algorithm and modifications
- Application
 - Support application of TraceContract within LADEE mission
 - Apply to logs for JPL mission
- Related topics
 - Inferring properties from runs
 - Annotating logs (Rajeev Joshi)
 - Program visualization

Runtime Verification	Going Parametric	QEA	TraceContract	ScalaRules	Conclusion
Conclusion					

- Efficient state of the art systems lack expressiveness
- · We attempt to increase expressiveness while staying efficient
- Result should be efficient and expressive RV system
- RV is a scalable way to understand complex systems
- Scala as prototyping language + internal DSLs speed up development
